* ERS Washington estimate.

1/ Less than 500.

2/ Excluding sulphur oil.

3/ Oil pressed in marketing season beginning November 1.

4/ About half goat milk; most of the remainder fairly equal portions of cow's and sheep's milk.

5/ About 10 percent pork; the remainder is roughly equal amounts of beef and veal, mutton and lamb.

* ERS Washington estimate.

1/ Less than 500 metric tons.

2/ Excludes sulphur oil.

3/ Oil pressed in marketing season beginning November 1.

4/ Covers Tripolitania, only.

5/ Goat's milk equals over 40 percent, sheep's milk about 30 percent, cow's milk 20 percent; the remainder is camel's milk.

6/ About two-thirds sheep and goats. Remainder largely camels and cattle.

* ERS Washington estimate.

1/ Excluding sulphur oil.

2/ Oil pressed in marketing season beginning November 1.

3/ Cows milk is first in importance followed by goat and sheep.

4/ About two-thirds mutton and lamb. The remainder principally beef and veal, but poultry is increasing.

* ERS Washington estimate

1/ Cow's milk is of first importance, followed by sheep, goat, and camel.

^{2/} Estimated at about 40 percent cattle, 20 percent sheep, 15 percent goat, 10 percent camel, and the remainder is made up of poultry and other meat.

Notes on the Indices of Agricultural Production

The attached tables present revised indices of agricultural production for 29 countries of Africa. These indices were calculated on a 1957-59 base and include total production data (unless otherwise noted) for year 1954 through 1965. They represent the latest production estimates as of the date appearing on the upper right corner of each country table.

Production data were compiled from country government official sources, attache reports, and estimates made by Foreign Agricultural Service, U.S.D.A. If no data from these sources were available, the country specialist, Economic Research Service, U.S.D.A. made his own estimate and usually noted it as "ERS/Washington estimate."

The time period designation is a calendar year and represents the years of harvest of most crops grown in this area. However, it does include some crops for which the harvest continues into the early part of the next year.

In the case of coffee and cocoa beans, the production of which is reported by Foreign Agricultural Service for crop years beginning for most countries in Africa about September or October, the entire crop has been assigned to the calendar year in which the harvest began. This is because, for the continent as a whole, the bulk of the harvesting occurs before December 31.

The weights used in computing country indices are estimates of the average price (in dollars) per metric ton received by producers of that country during the 1957-59 base period. More recent price data were used for some countries where adequate price data were not available for the base years. Where price data were unavailable an estimate was made. The inadequacy of price statistics for this region is well known, so all weights are subject to revision as better data are received.

To calculate the indices for each country, the production of each commodity in 1,000 metric tons was multiplied by the price weight and the resulting extension rounded to the nearest \$100,000. Crop extensions were then summed for each year, as were the livestock extensions. An estimate of the crop production that was fed to livestock was subtracted from this. The latter step was an attempt to eliminate double counting. The resulting agricultural production aggregates were divided by the aggregate for the base period to obtain the agricultural production index for each year. The per capita indices were obtained by dividing the indices of total agricultural production by the population indices.

The same procedure was followed in calculating the food production index, but only edible commodities were used. All commodities are considered edible except tobacco, tea, coffee, chicory, pepper, cloves, castor beans, vanilla, cotton lint, rubber, sisal, urena and punga, piassava, wool, mohair, tung oil, hides and skins, and pyrethrum flowers. Because no consideration was taken of changes in stocks, foreign trade, seed, and waste, the indices of total and per capita food production are not to be regarded as indices of consumption.

Not all crops and livestock products produced in a country are necessarily reported. Only those with significant production or where a reasonable estimate of production could be made were used.
